Optimal Currency Areas

$$E(m_{t}^{K}-m_{t}^{KR})^{2}=\frac{1}{2}\sigma_{K}^{2}(1-r_{KR})$$

KENT STATE

Lectures in Macroeconomics- Charles W. Upton

The Euro

- The Euro is an example of a currency union.
- The nations abandoned independent monetary authority to get a common currency.

KENT STATE

Optimal Currency Area

The Euro

- The Euro is an example of a currency union.
- The nations abandoned independent monetary authority to get a common currency.
- But how big? How many nations should join?

KENT STATE

Optimal Currency Area

The Problem

- Suppose the city of Kent had its own currency (Kent \$, or \$_K) and its own monetary authority.
- The exchange rate against other currencies (such as Ravenna dollars, \$_R, floats)

KENT STATE

Optimal Currency Area

The Proposal

• Should the cities of Kent and Ravenna merge their currencies and create a common currency, \$\sigma_{KR}\$?

KENT STATE

Optimal Currency Area

The Proposal

- Should the cities of Kent and Ravenna merge their currencies and create a common currency, \$_KR?
- If they do, there will be a single monetary authority which will determine the optimal monetary policy for the Kent-Ravenna economy.

KENT STATE

Optimal Currency Area

Advantages

- A single currency will mean lower transactions costs in so many ways.
- Persons in Ravenna can trade in Kent without having to worry about exchange fluctuations and without having to exchange \$_R for \$_K
 - And vice versa.

KENT STATE

Optimal Currency Area

7

11

Advantages

- Investors in the Kent-Ravenna can invest with reduced worries about exchange rate fluctuations.
- Or alternatively: projects in Kent and Ravenna can attract out of area investment without having to guarantee investors against exchange rate fluctuations.

KENT STATE

Optimal Currency Area

Disadvantages

- Right now the Kent monetary authority sets the rate of monetary expansion m^K at m^K, the optimal rate for Kent.
- Ditto, in Ravenna where $m^R = m_t^R$.
- · A single monetary authority will set

$$m_{\scriptscriptstyle t}^{\scriptscriptstyle KR} = \frac{1}{2} (m_{\scriptscriptstyle t}^{\scriptscriptstyle K} + m_{\scriptscriptstyle t}^{\scriptscriptstyle R})$$

KENT STATE

Optimal Currency Area

The Loss

$$m_{\scriptscriptstyle t}^{\scriptscriptstyle KR} = \frac{1}{2} (m_{\scriptscriptstyle t}^{\scriptscriptstyle K} + m_{\scriptscriptstyle t}^{\scriptscriptstyle R})$$

KENT STATE

Optimal Currency Area

The Loss

$$m_{t}^{KR} = \frac{1}{2} (m_{t}^{K} + m_{t}^{R})$$

$$m_{t}^{K} - m_{t}^{KR} = \frac{1}{2} (m_{t}^{K} - m_{t}^{R})$$

KENT STATE

Optimal Currency Area

The Loss $m_{t}^{KR} = \frac{1}{2} (m_{t}^{K} + m_{t}^{R})$ $m_{t}^{K} - m_{t}^{KR} = \frac{1}{2} (m_{t}^{K} - m_{t}^{R})$ $(m_{t}^{K} - m_{t}^{KR})^{2} = \frac{1}{4} (m_{t}^{K} - m_{t}^{R})^{2}$ EVENT STATE

Some Analysis

• The optimal monetary policy at time t is

$$m_{t}^{K} = m_{*}^{K} + \varepsilon_{t}^{K}$$

KENT STATE

Optimal Currency Area

Some Analysis

$$m_{t}^{K} = m_{*}^{K} + \varepsilon_{t}^{K}$$
 $\varepsilon_{t}^{K} \sim N(0, \sigma_{K}^{2})$

KENT STATE

Optimal Currency Area

Some Analysis

• The optimal monetary policy at time t is

$$m_{t}^{R} = m_{*}^{R} + \varepsilon_{t}^{R}$$

KENT STATE

Optimal Currency Area

Some Analysis

$$m_t^R = m_*^R + \varepsilon_t^R$$

 $\varepsilon_L^R \sim N(0, \sigma_R^2)$

KENT STATE

Optimal Currency Area

The Loss

$$\left(m_{t}^{K}-m_{t}^{KR}\right)^{2}=\frac{1}{4}\left(m_{*}^{K}-m_{*}^{R}+\varepsilon_{Kt}-\varepsilon_{Rt}\right)^{2}$$

KENT STATE

Optimal Currency Area

Assume $m^{K_*} = m^{R_*}$

Assume
$$\sigma_{K}^{2} = \sigma_{R}^{2}$$

$$\left(m_{t}^{K} - m_{t}^{KR}\right)^{2} = \frac{1}{4}\left(m_{*}^{K} - m_{*}^{R} + \varepsilon_{Kt} - \varepsilon_{Rt}\right)^{2}$$

KENT STATE

17

Optimal Currency Area

The Loss

$$E(m_t^K - m_t^{KR})^2 = \frac{1}{4}(\sigma_K^2 + \sigma_R^2 - 2\operatorname{cov}(\varepsilon_{Kt}, \varepsilon_{Rt})) = \frac{1}{2}\sigma_K^2(1 - r_{KR})$$

KENT STATE

Optimal Currency Area

The Loss

 $r_{KR} = 1$, no cost from merging

$$\frac{1}{4}(\sigma_{K}^{2} + \sigma_{R}^{2} - 2\operatorname{cov}(\varepsilon_{Kt}, \varepsilon_{Rt})) = \frac{1}{2}\sigma_{K}^{2}(1 - r_{KR})$$

KENT STATE

Optimal Currency Area

20

The Loss

 $r_{KR} = 0$, a cost from merging

$$\frac{1}{4}(\sigma_{K}^{2} + \sigma_{R}^{2} - 2\operatorname{cov}(\varepsilon_{Kt}, \varepsilon_{Rt})) = \frac{1}{2}\sigma_{K}^{2}(1 - r_{KR})$$

KENT STATE

Optimal Currency Area

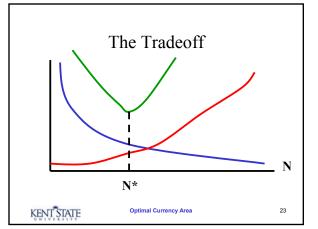

The Theorem

- There are gains in lower transactions costs.
- But, if the two economies are independent, there will be a loss from having a monetary authority that is focused on the local area.
 - The magnitude of the loss depends on the degree of independence

KENT STATE

Optimal Currency Area

-00

West Backwater

- West Backwater wants to join either the US dollar or the Euro.
- Gains in transactions costs but what about deviations from monetary policy?
- WB citizens do not vote in American elections and will get no say in FOMC.

KENT STATE

Optimal Currency Area

West Backwater

- Do they do more trading with EMU or with US?
 - If US, use dollar.
 - If EMU use Euro.

KENT STATE

Optimal Currency Area

25

The United Kingdom

- The UK does more trading with the EMU than with the US.
- Thus if they want to join, they should EMU but not use US \$.
- Unlike West Backwater, they can get a seat on the board of the European Central Bank.

KENT STATE

Optimal Currency Area

26

Canada

- If they want to join, they should use US \$.
- But it seems unlikely that we would give Canada a seat on the FOMC.
- And they may be large enough that there are no gains in transactions costs.

KENT STATE

Optimal Currency Area

Ecuador

- No hope of a seat on FOMC.
- But no one had confidence in domestic monetary policy.
